Precipitation and Evaporation Datasets

Tables

Figures

Table A1: Meteorological Data Sources and Stations

Precipitation

Source	Station	Code	Period	Region	Primary/Secondary
NCDC	CHILOQUIN 12 NW	351574	1991-2010	North	Primary
Agrimet	Agency Lake	AGKO	2000-2010	North	Secondary
NCDC	KLAMATH FALLS 2 SSW	354506	1991-1998	South	Primary (1991-1998)
NCDC	KLAMATH FALLS INTL AP	94236	2000-2010	South	Primary (1999-2010)
NCDC-GSOD	KFA	94236	1990-2011	South	Secondary
Agrimet	Klamath Falls	KFLO	2000-2011	South	Secondary

Evaporation

Source	Station	Code	Period
OSU Experiment Station	Klamath Falls	--	1991-2003
Agrimet	Klamath Falls	KFLO	2004-2010

Figure A1: Map of Meteorological Stations

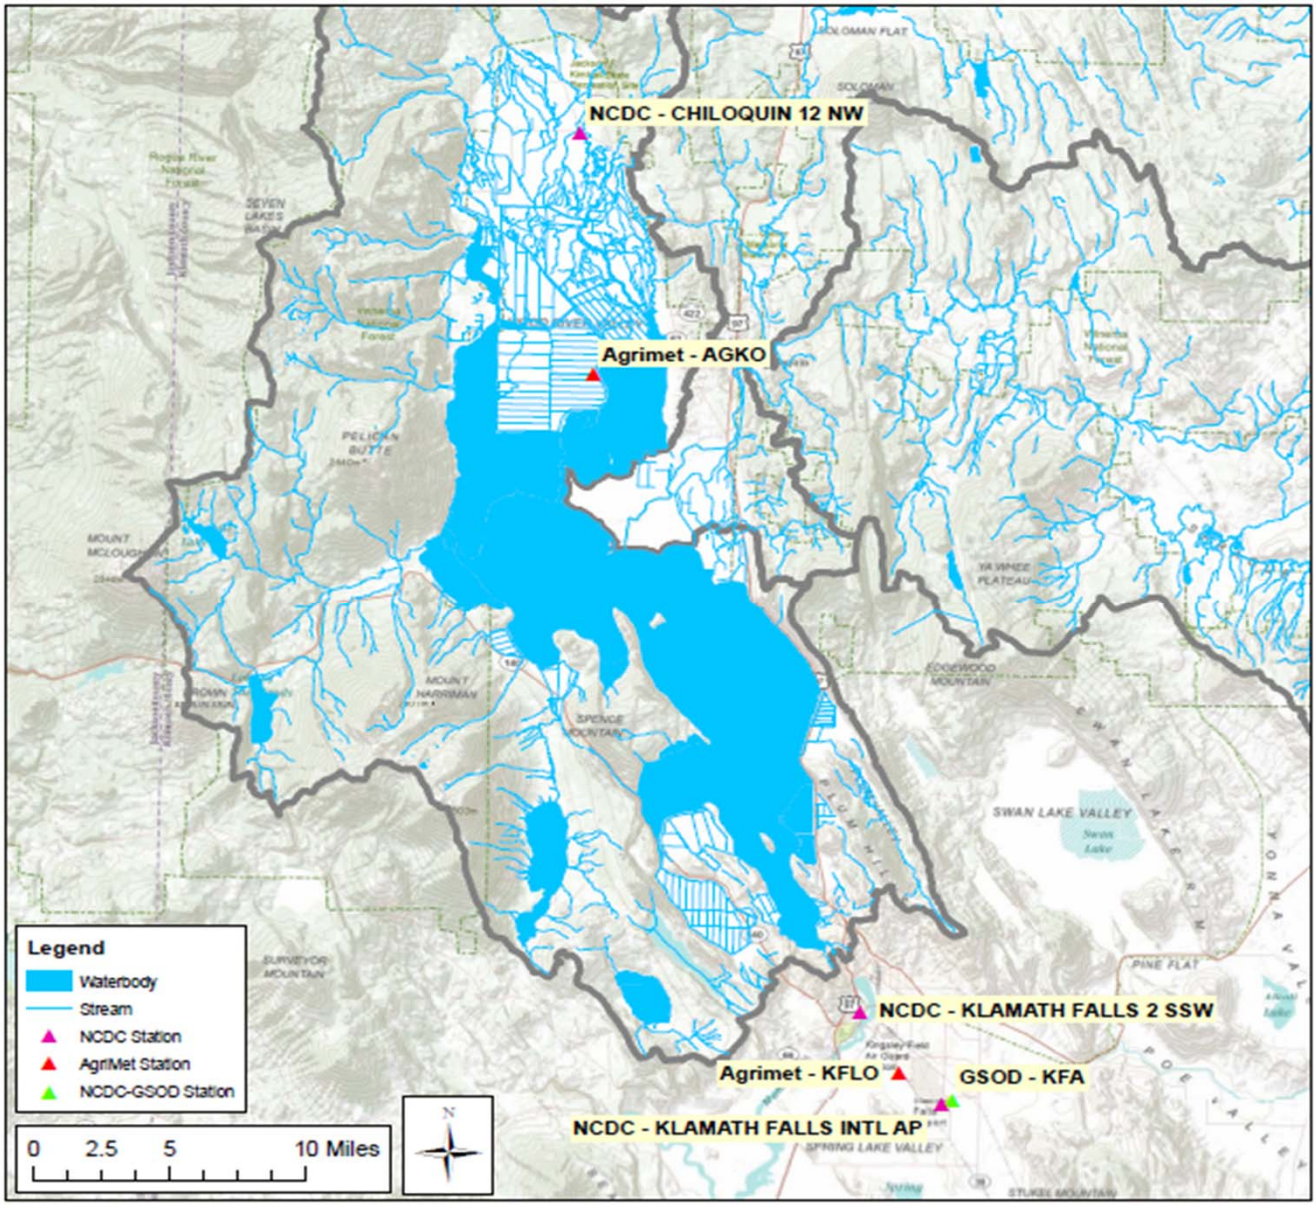

Figure A2: Spatial Distribution of Annual Precipitation (from ODEQ, 2002)

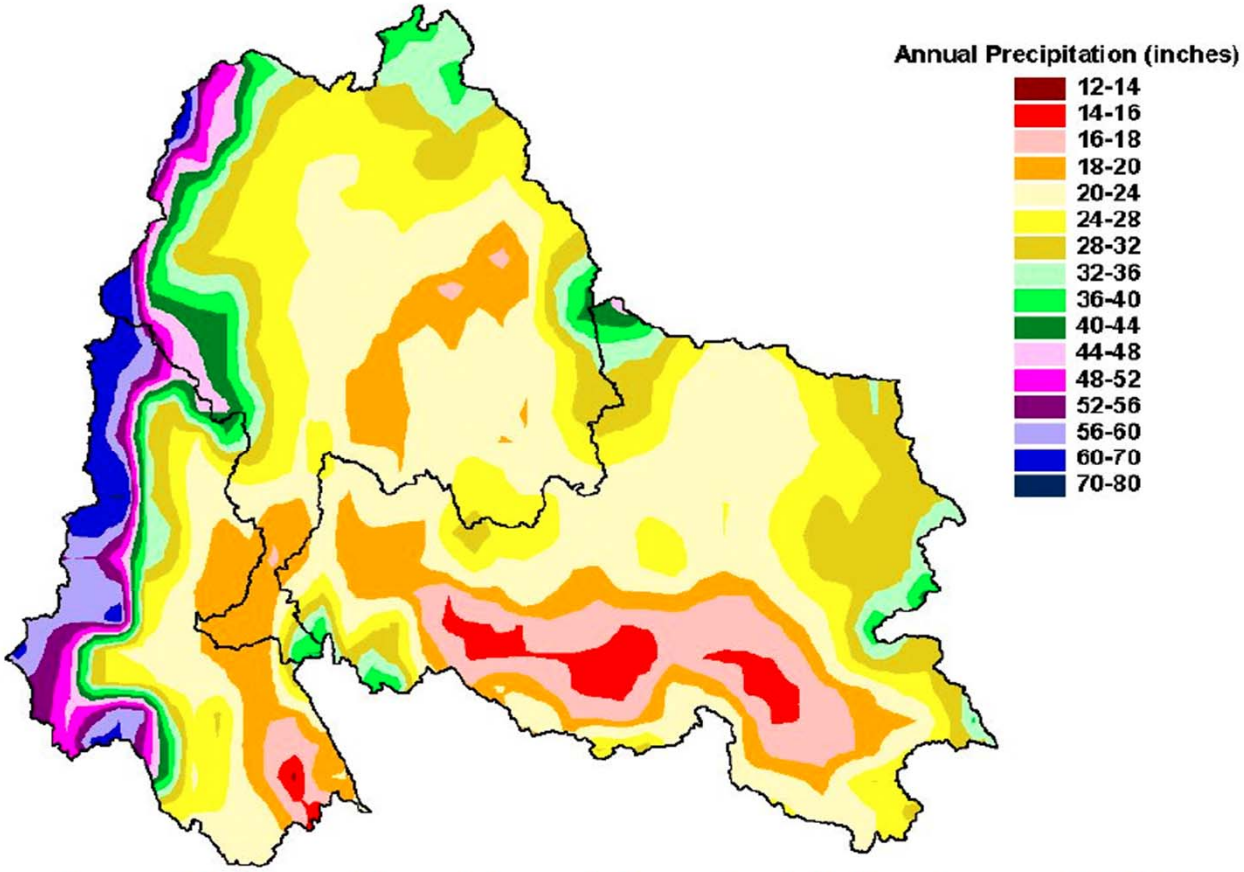

Figure 1-5. Upper Klamath Lake drainage Precipitation (Oregon SSCGIS)

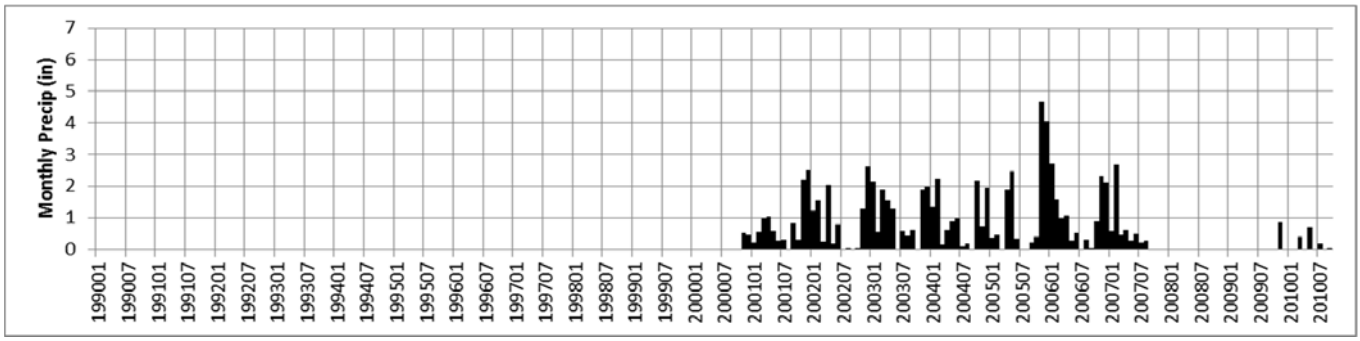
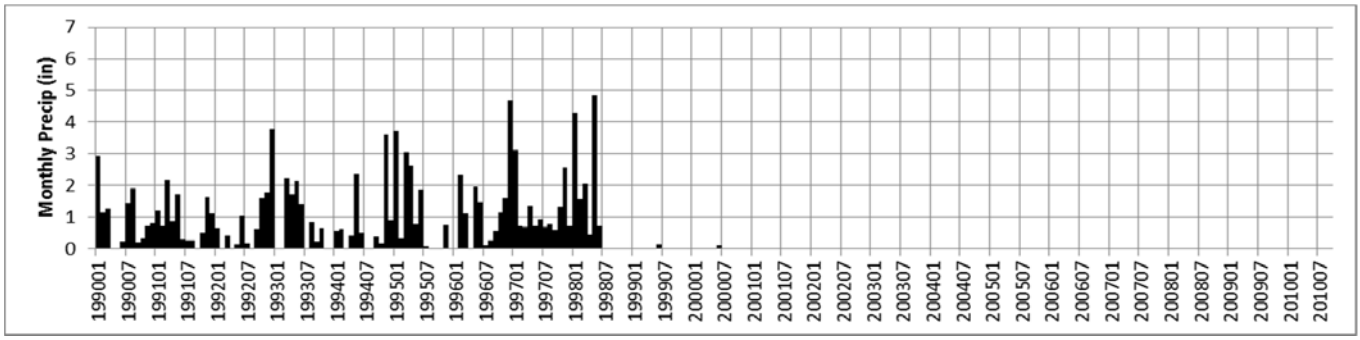
Figure A3: Monthly Precipitation by Station

Southern Stations (near Klamath Falls)

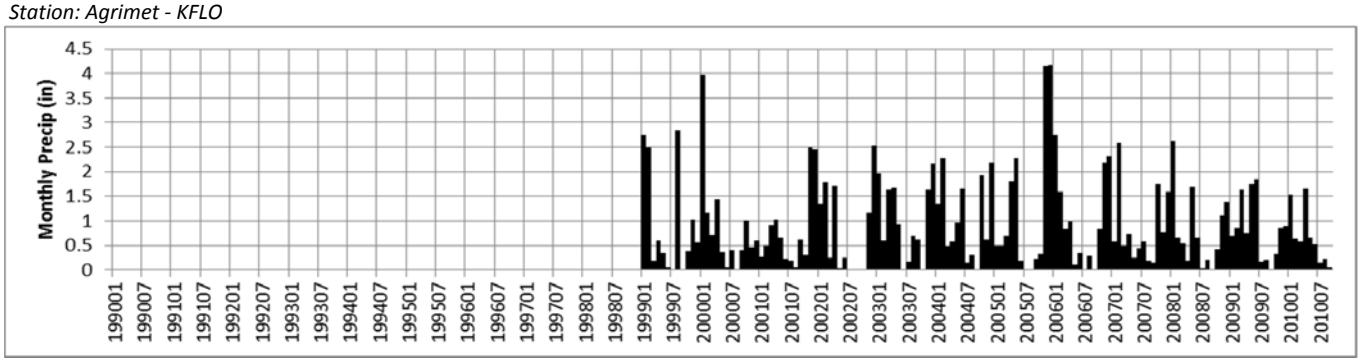
Station: NCDC - KLAMATH FALLS INTL AP



Station: NCDC - KLAMATH FALLS 2 SSW



Station: Agrimet - KFLO



Station: NCDC-GSOD - Klamath Falls Airport

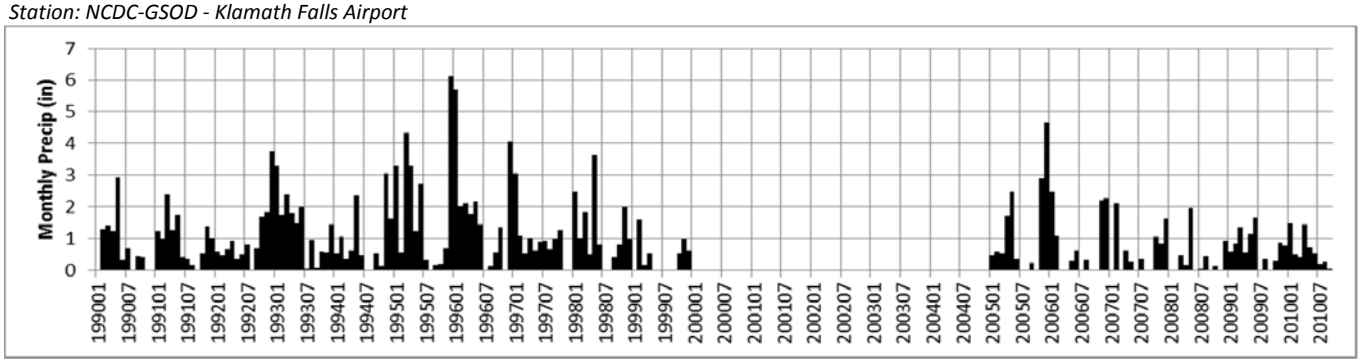


Figure A3: Monthly Precipitation by Station (cont'd)

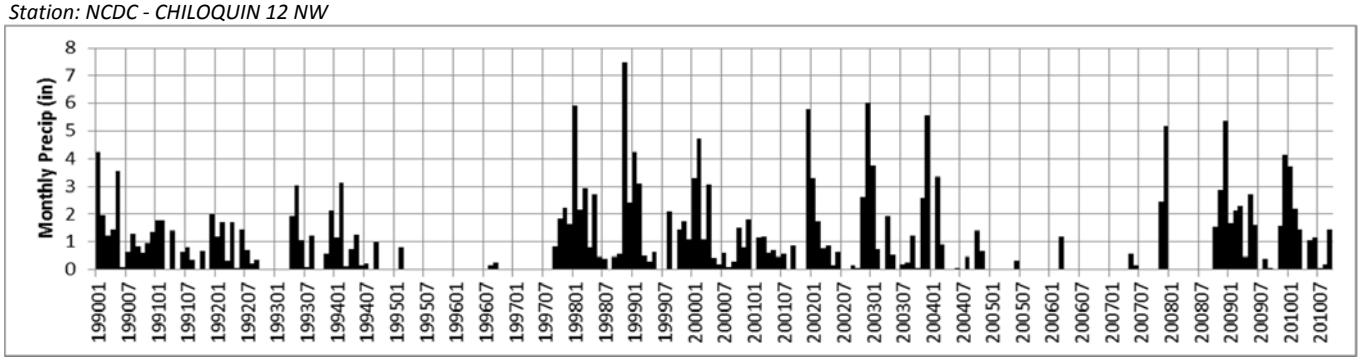
Northern Stations (near Agency Lake)

Station: NCDC - CHILOQUIN 12 NW



Station: Agrimet - AGKO

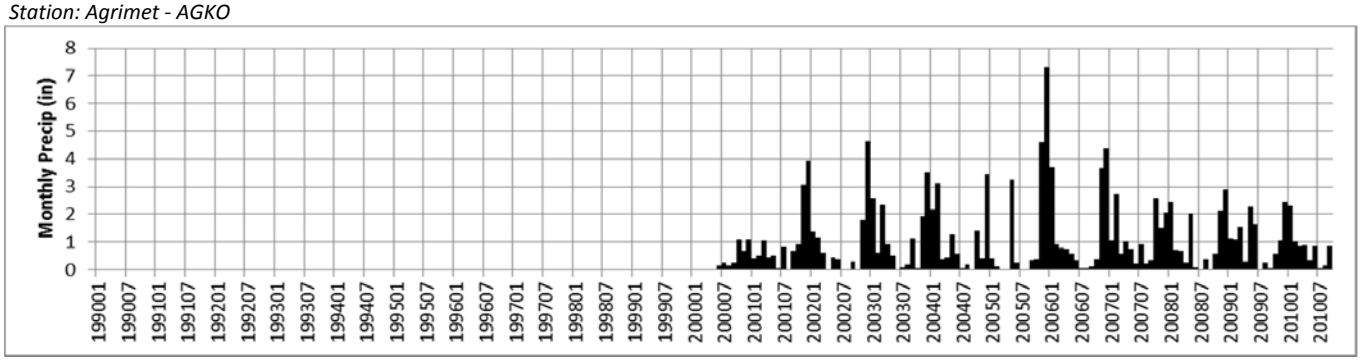


Figure A4: Monthly Precipitation Relationships by Region

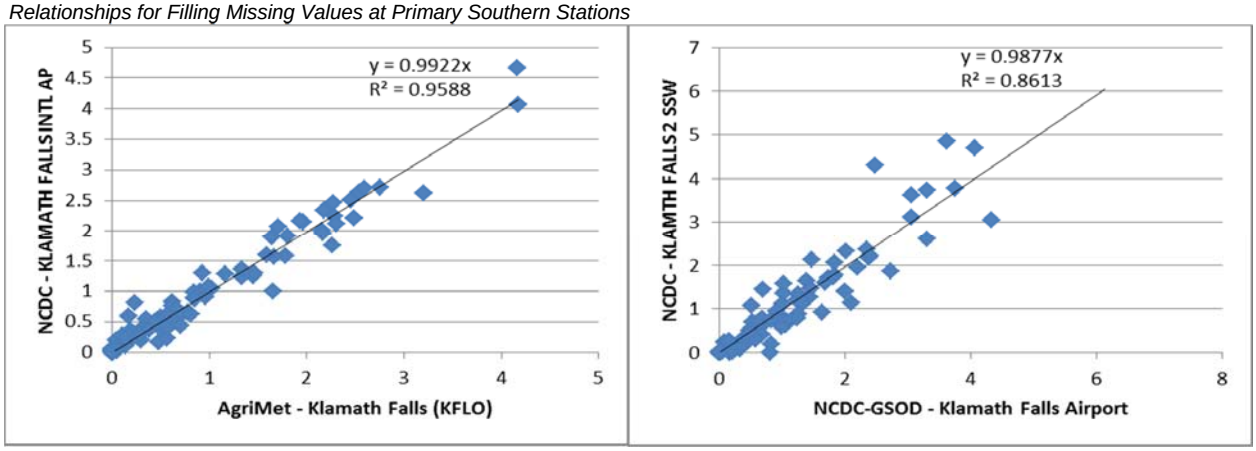
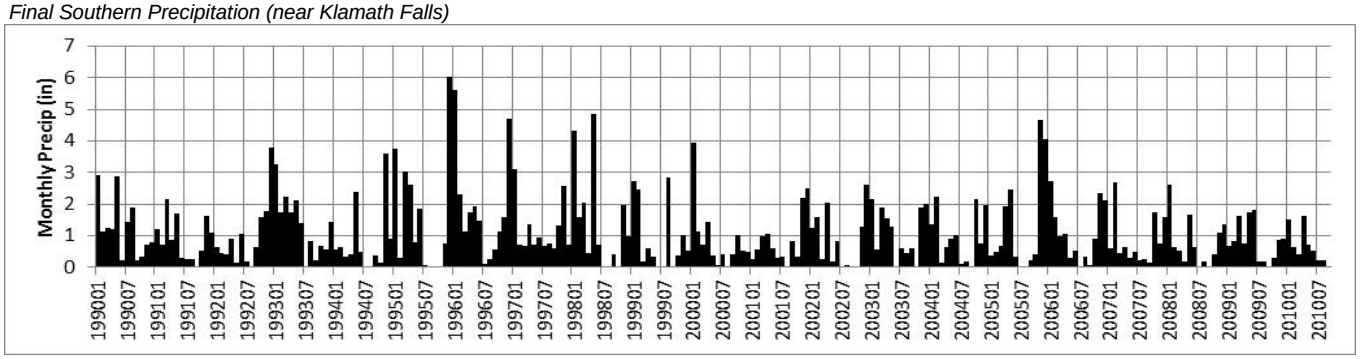
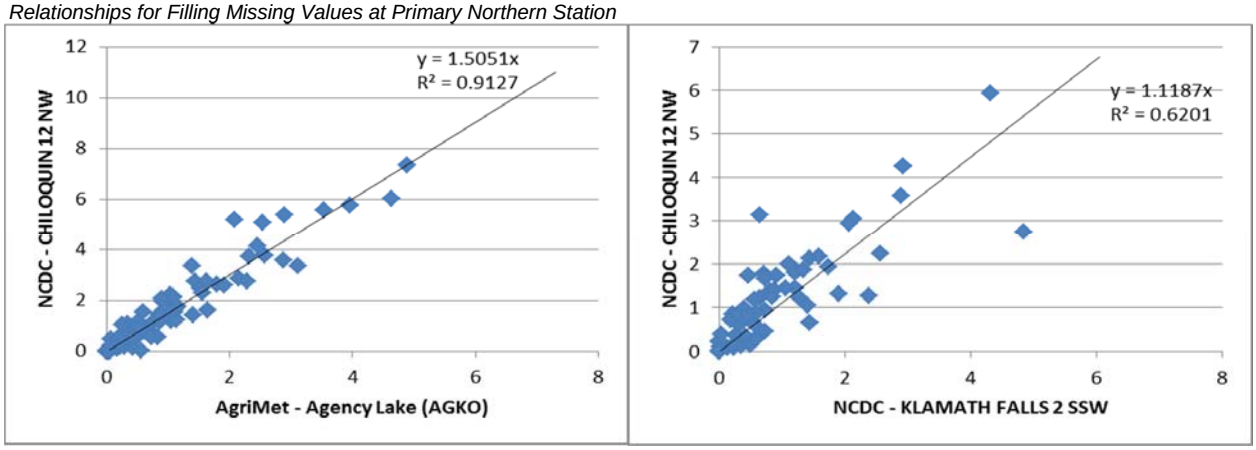
Relationships for Filling Missing Values at Primary Southern Stations



Final Southern Precipitation (near Klamath Falls)



Relationships for Filling Missing Values at Primary Northern Station



Final Northern Precipitation (near Agency Lake)

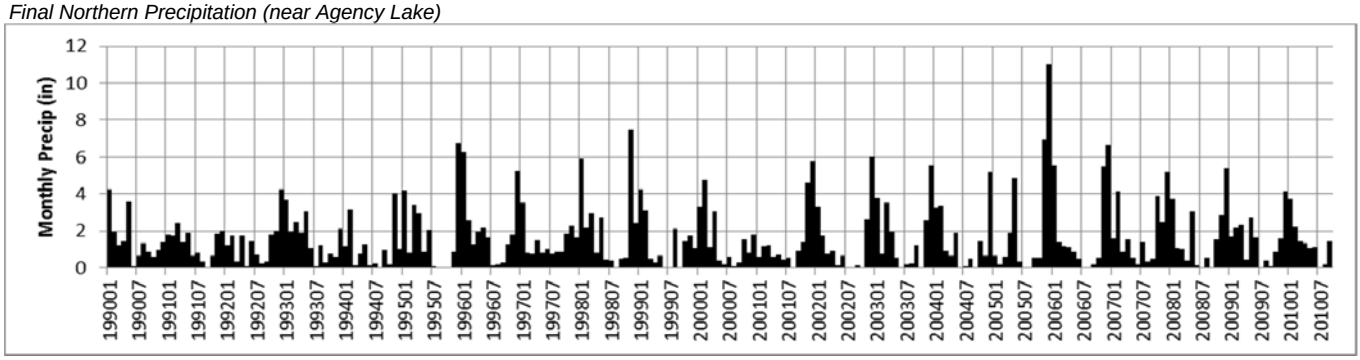


Figure A5: Final Monthly and Annual Precipitation

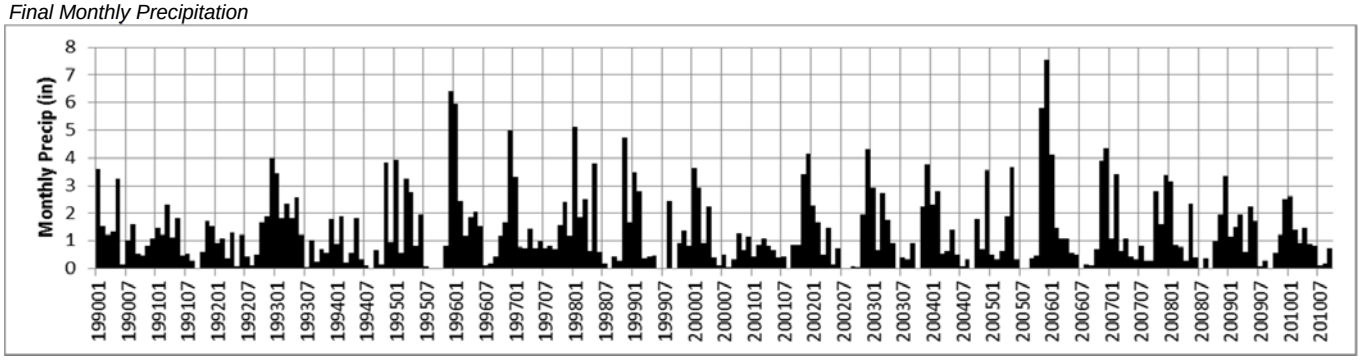
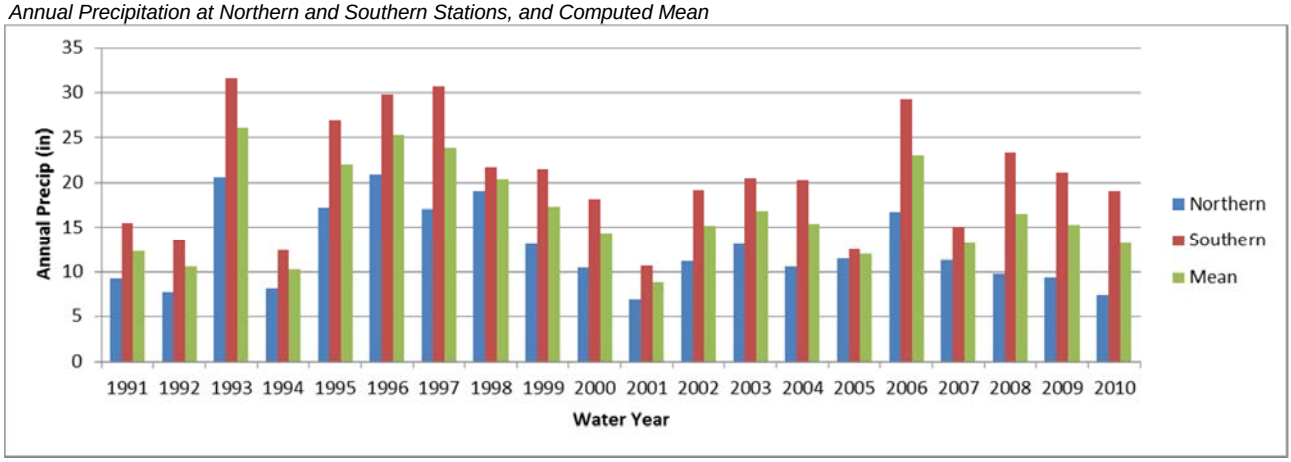
Final Monthly Precipitation



Notes: computed as mean of final northern and southern precipitation (see Figure A4)

Annual Precipitation at Northern and Southern Stations, and Computed Mean



Comparison of Current Annual Precipitation to Kann & Walker (1999)

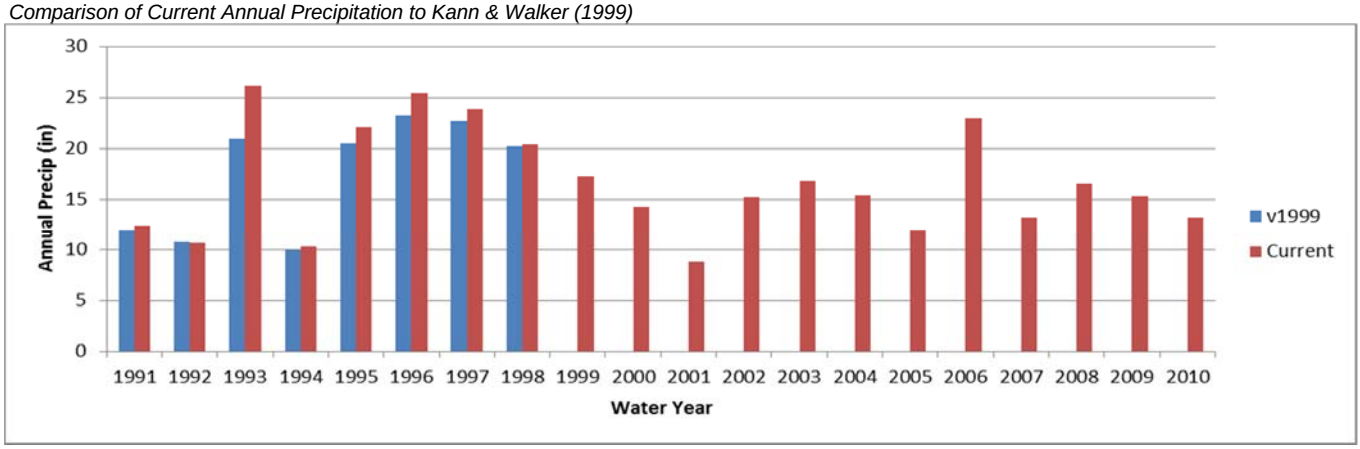


Figure A6: Monthly Evaporation by Station

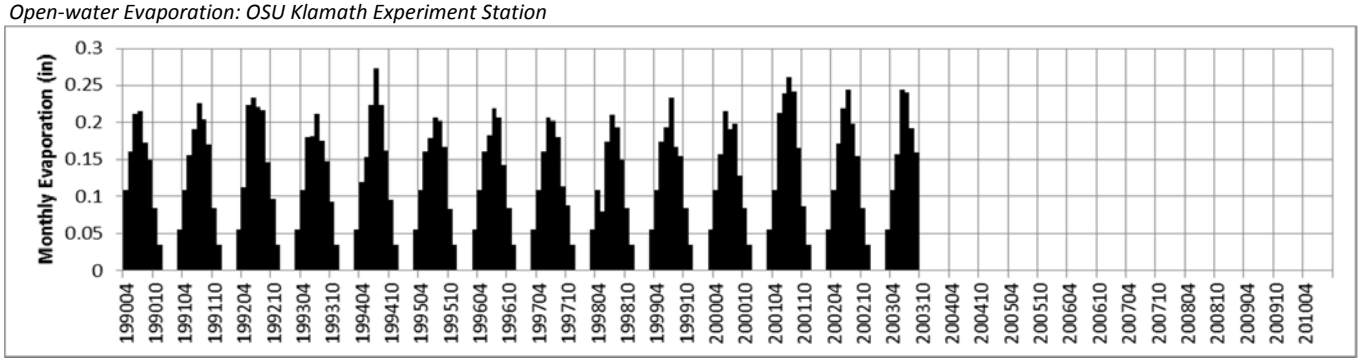
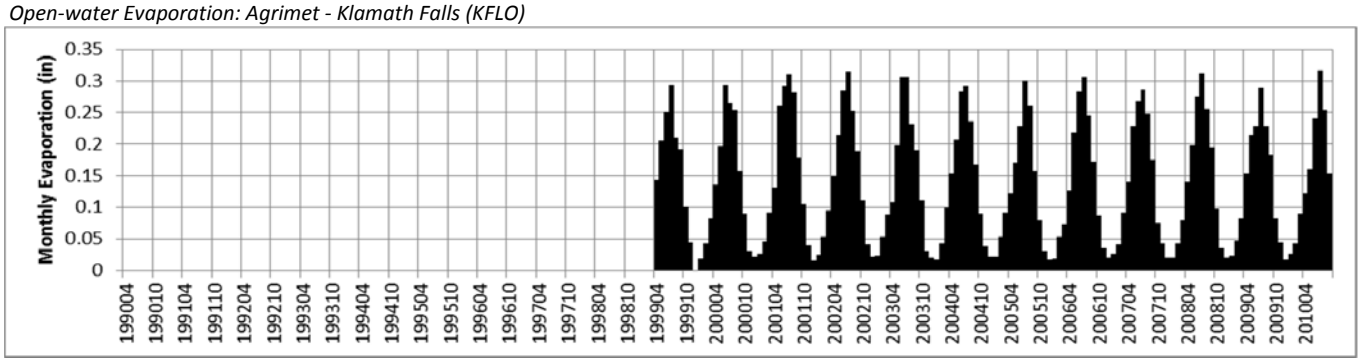
Open-water Evaporation: OSU Klamath Experiment Station



Notes: computed from pan evaporation measurements using pan coefficient of 0.7

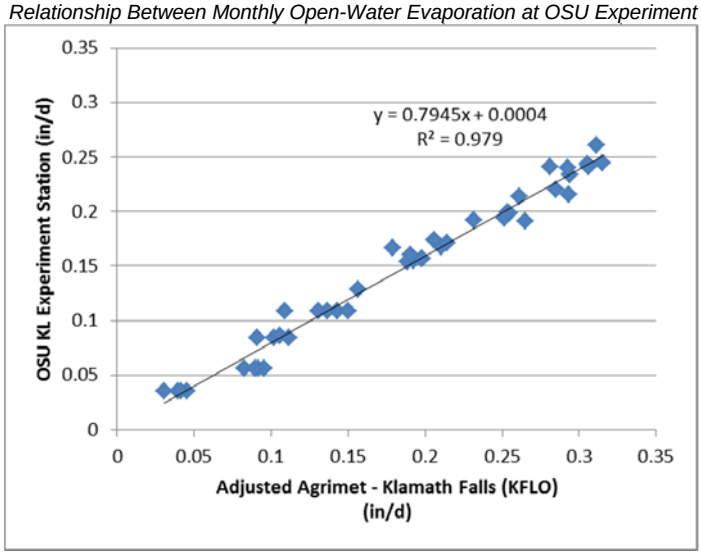
Open-water Evaporation: Agrimet - Klamath Falls (KFLO)



Notes: open-water evaporation computed from PET measurements using Evap=1.27*0.7*PET (Hostetler, 2009)

Figure A7: Monthly Evaporation Relationships

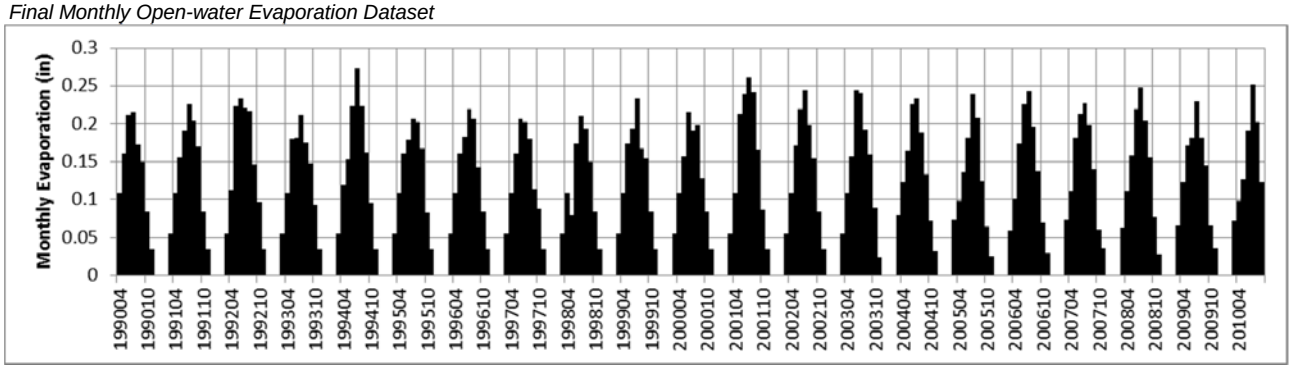
Relationship Between Monthly Open-Water Evaporation at OSU Experiment Station and Agrimet-Klamath Falls (KFLO) Station



Notes: excludes data in December-February

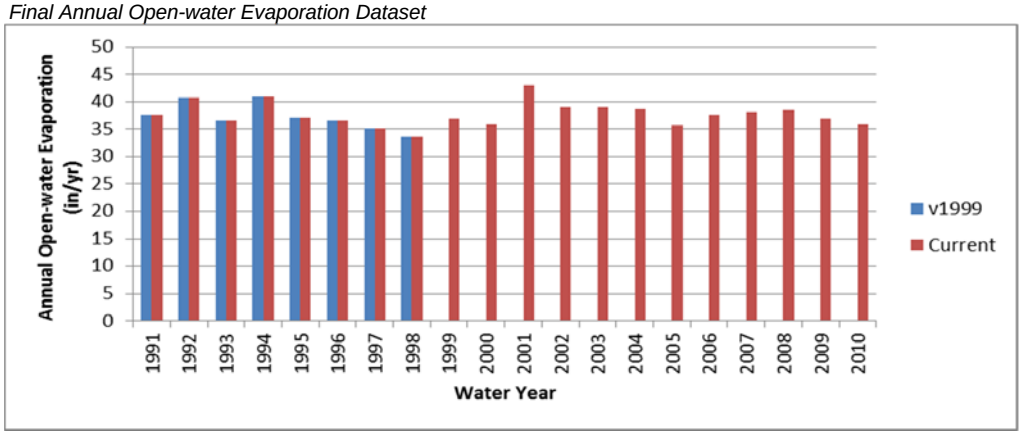
Figure A8: Final Monthly and Annual Evaporation Datasets

Final Monthly Open-water Evaporation Dataset



Notes: For water years 1991-2003, uses estimated open-water evaporation based on pan evaporation at OSU Experiment Station
For water years 2004-2010, uses estimated open-water evaporation based on PET at Agrimet KFLO adjusted by regression
Assumes zero evaporation in December-February

Final Annual Open-water Evaporation Dataset



Notes: Comparison of Annual Evaporation Dataset to Kann & Walker (1999)

Appendix B
Flows & Nutrient Loads from Tributaries

Tables

Figures

Table B1: Algorithm for Estimating Daily Loads using Daily Flow & Biweekly Concentration Data

Computation of Load in Day (T):

LOAD(T) = FLOW(T) x CONC (T)
LN CONC (T) = PREDICTED (T) + RESID (T)
PREDICTED (T) = LN (Concentration Predicted by Regression Model on Day T)
RESID (T) = Regression Residual for Day T Interpolated between Sampling Dates
Residual = LN (Observed / Predicted Concentration on Sampling Dates)

The regression is design to capture seasonality, flow dependence, and long-term trend.
The interpolation captures drift in the model residuals over time; i.e. serial correlation of errors, etc.
The interpolation forces the observed and predicted concentrations to be equal on each sampling date.
The intercept of the regression equation is adjusted to force the observed and predicted mean load across all sampling dates to be equal.
This is necessary to remove negative bias introduced in the log-scale regression.
In computing the seasonal terms, julian day is constrained to a range of 90-300 days to reflect relatively sparse sampling frequencies and
and relatively low variance in observed concentrations in the winter months.

Regression Model Terms: Y = LN (Conc)

Term	Description	
Reg_Q Deriv	Natural Log (Q (day) / Q (Day-1)), = 0 if either flow = 0	
Reg_Year^2	year = year + fraction of year = Year + julian Day / 365.25	
Reg_Year	"	
Reg_Cos(2t)	t = 2 x Pi x Julian / 365.25	seasonality
Reg_Sin(2t)	"	"
Reg_Cos(t)	"	"
Reg_Sin(t)	"	"
Reg_Log q3	Natural Log (Q = flow)	flow-dependence
Reg_Log q2	"	"
Reg_Log q	"	"
Reg_Intercept	Regression Intercept, Predict Natural Log of Daily Conc	

Long-Term Average Loads are Compared Using Five Different Algorithms

Method 1	Constant flow-weighted-mean concentration
Method 2	Constant flow-weighted-mean concentration within low and high-flow strata (above and below the mean flow for the entire period)
Method 3	Simple Linear Interpolation of concentrations between sampling dates
Method 4	Regression without residual interpolation
Method 5	Regression with residual interpolation (used to estimate daily loads).

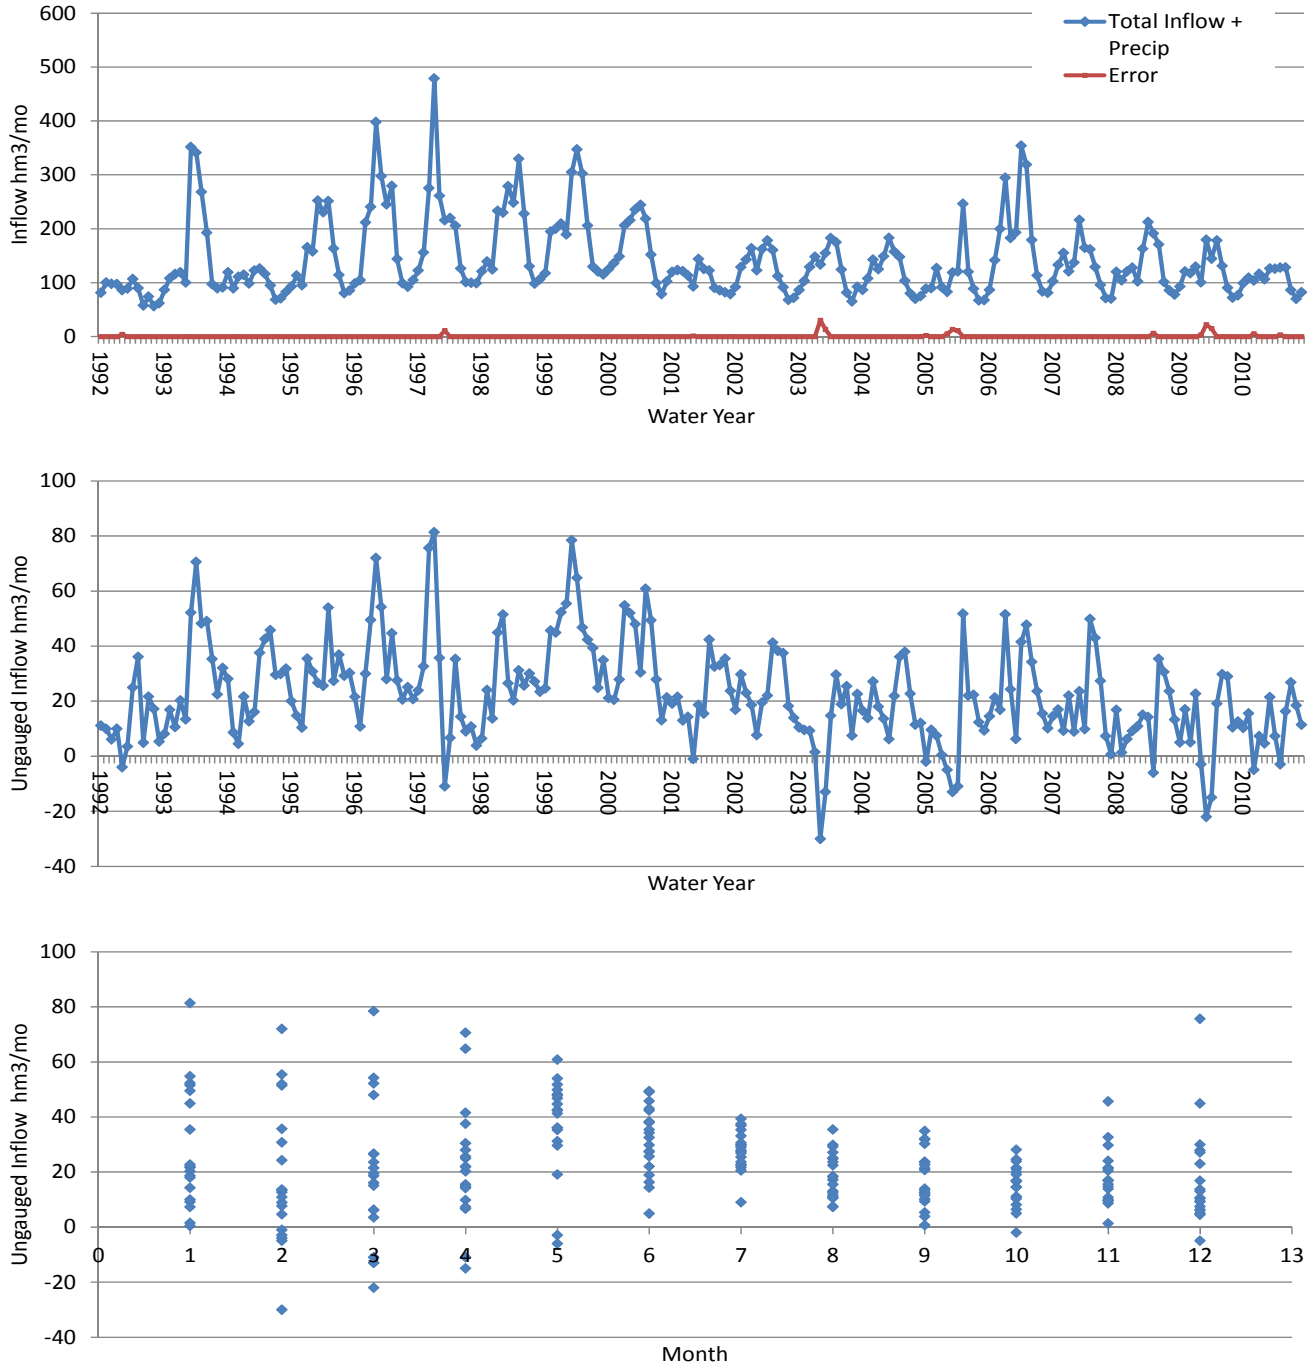
Intercept	6.22E+01
Slope1	5.02E-02
Slope2	-7.58E-04
Slope3	3.61E-06
R2	0.371

FIgure B4: Monthly Time Series of Estimated Ungauged Inflows



Ungauged = Total Outflow + Evaporation - Total Gauged Inflows - Estimated Pumped Inflows - Precipitation + Storage Increase
Constrained >=0 in formulating mass balances. This causes an error in the water budget in months when the computed ungauged inflows are negative.
The negative values could reflect errors in the measured or estimated inflow volumes. They tend to occur in the winter months, especially in drier years.
The top figure shows that the error is small relative to the total external inflow.

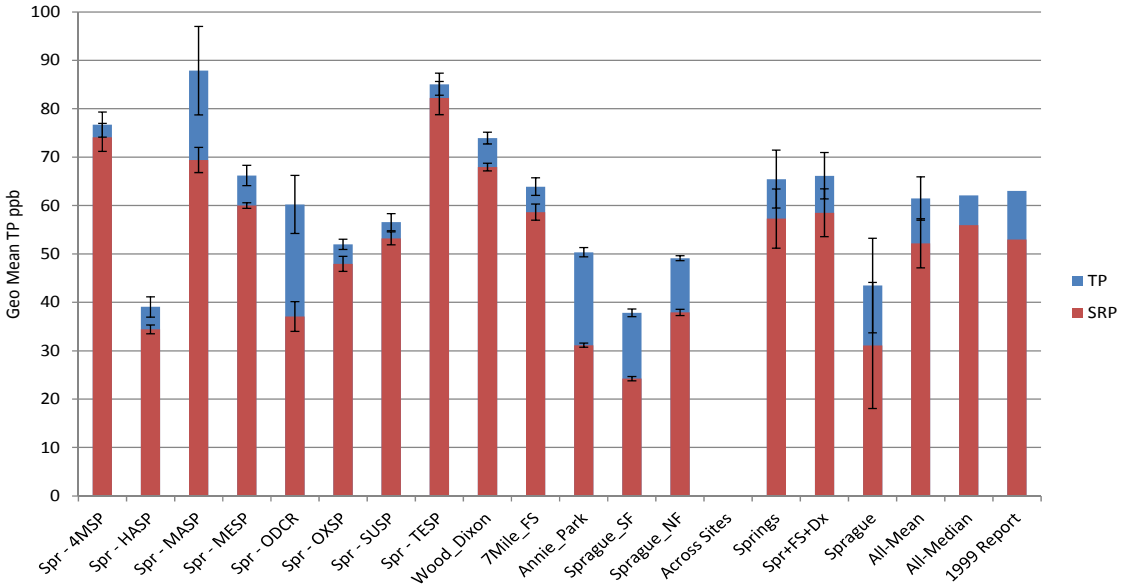
* Values Used to Estimate Concentrations in Ungauged Inflows to Lake



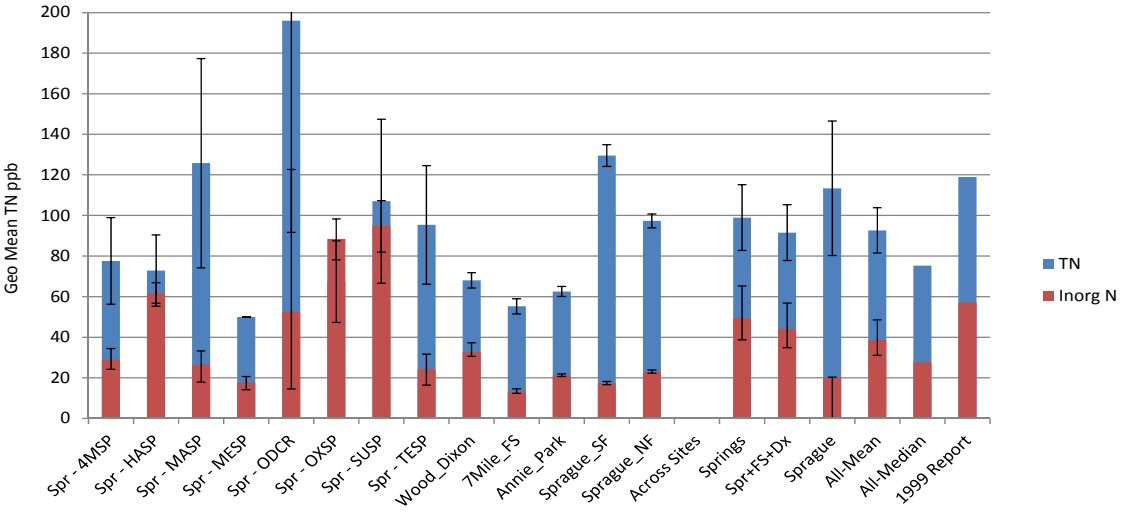


Figure D5: Spatial Variations in Flow, Nutrient Loads, and FWM Concentrations, Water Year

Water Years: 2002 thru 2010 Season: All

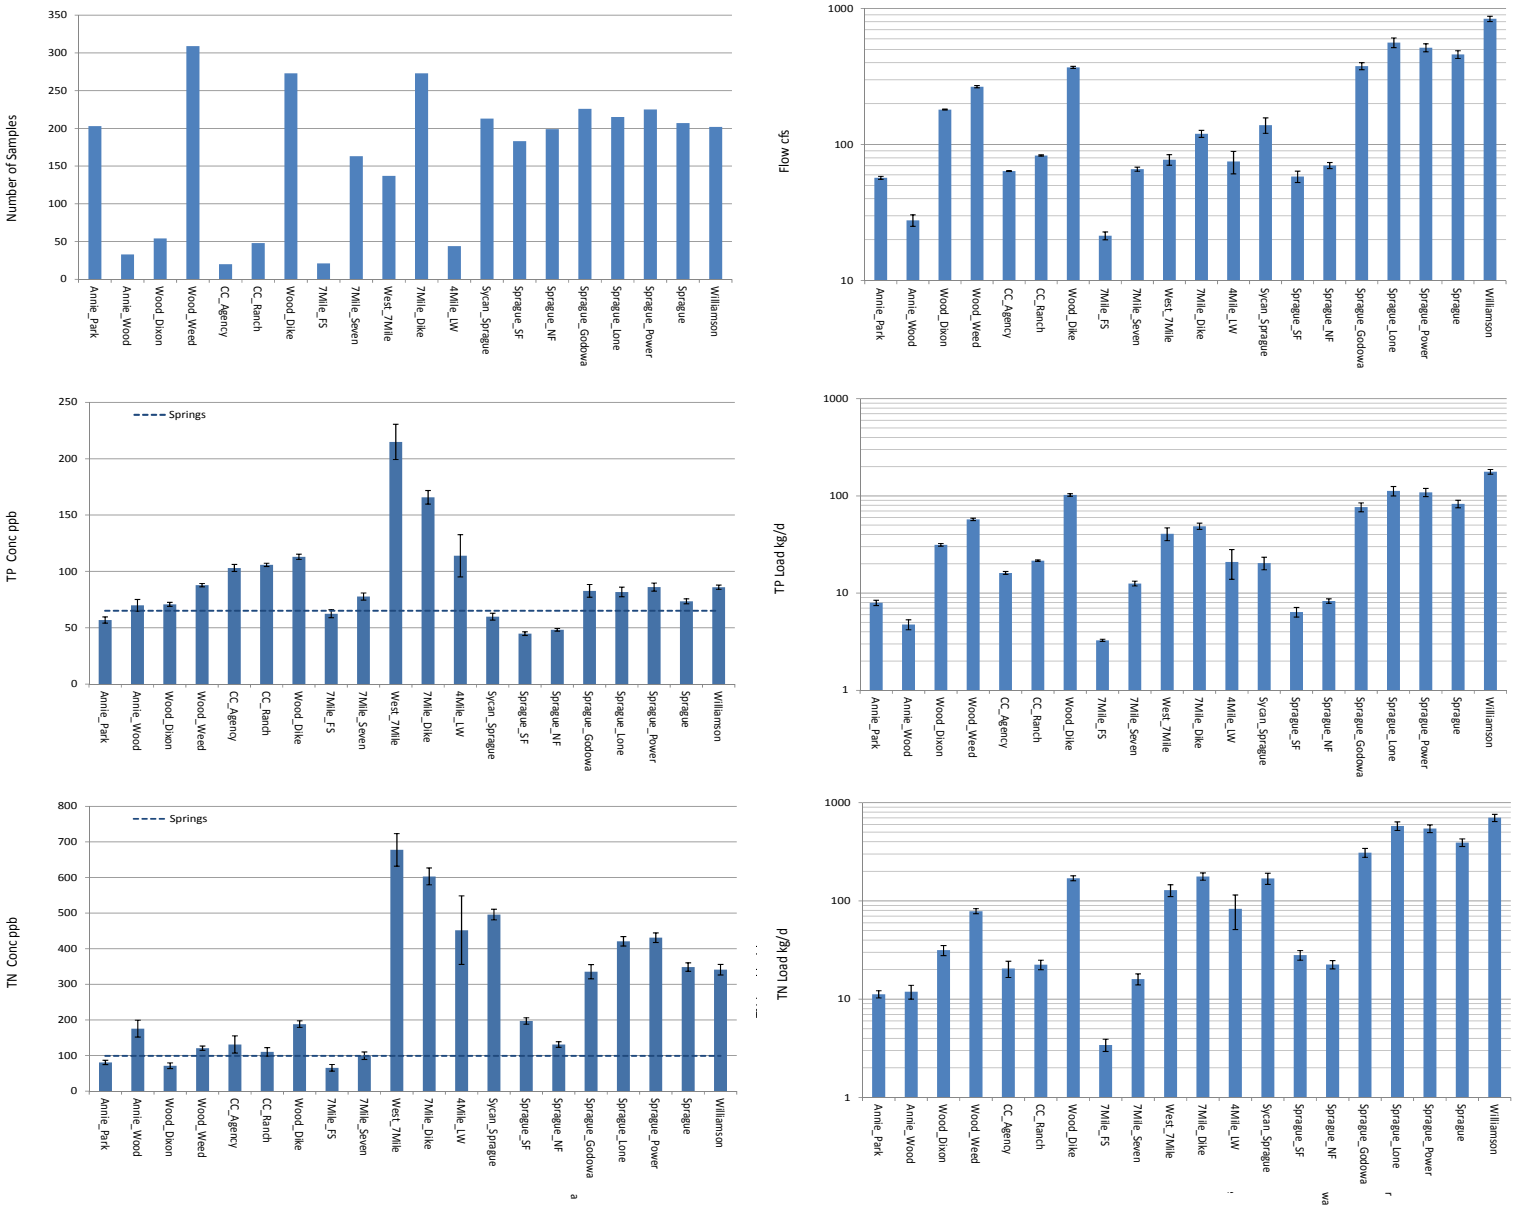

Figure D6: Spatial Variations in Flow, Nutrient Loads, and FWM Concentrations, October-April

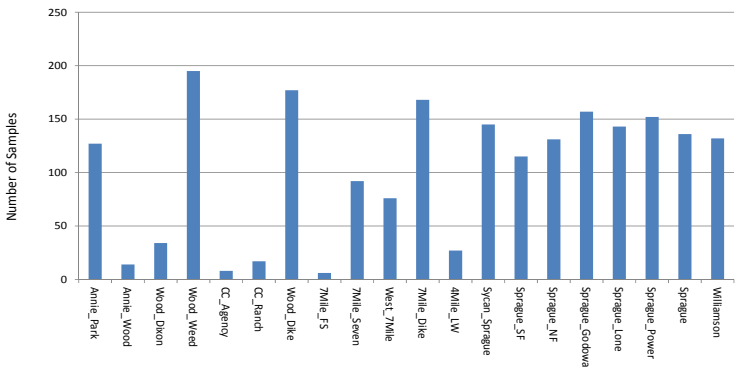
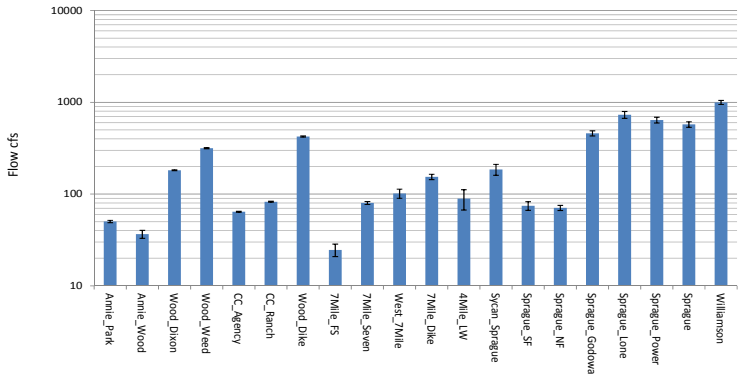
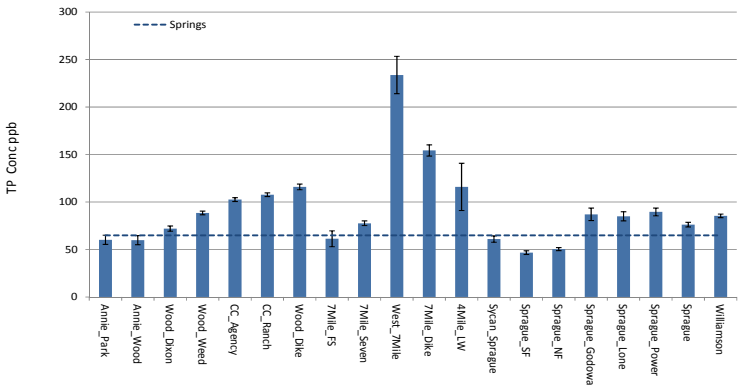
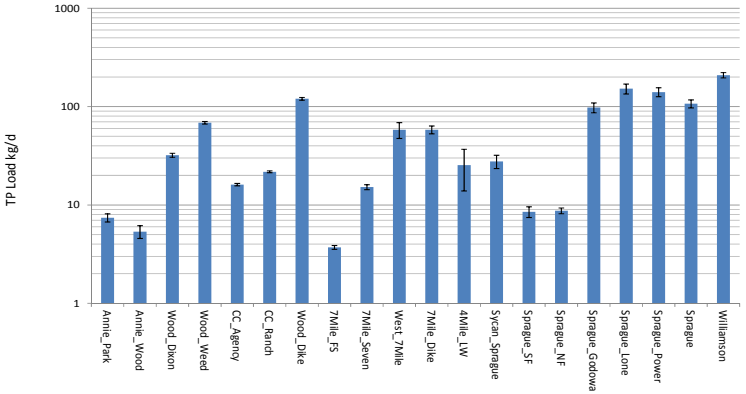
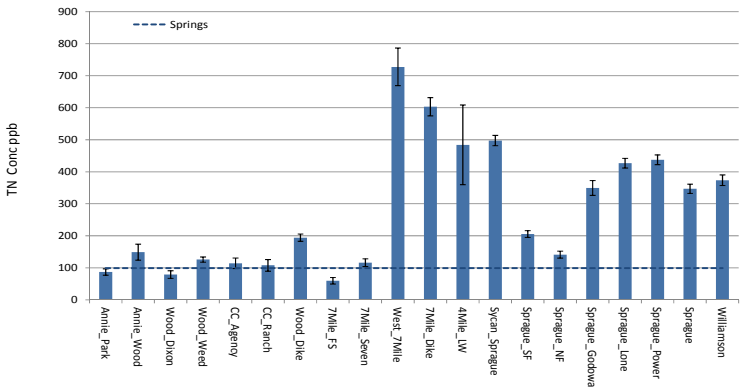
Water Years: 2002 thru 2010 Season: Oct-April











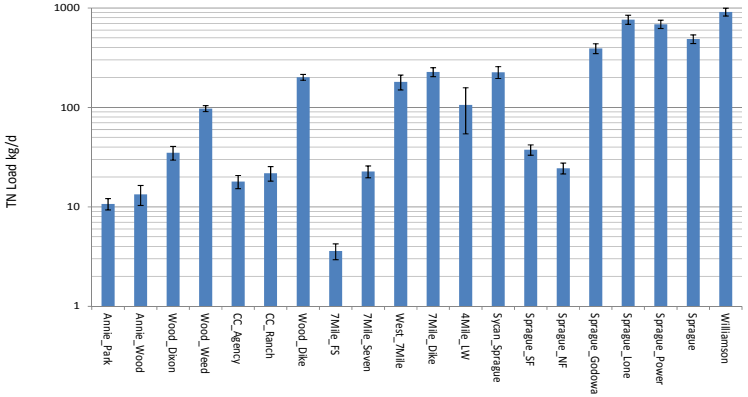


Figure D7: Spatial Variations in Flow, Nutrient Loads, and FWM Concentrations, May-September

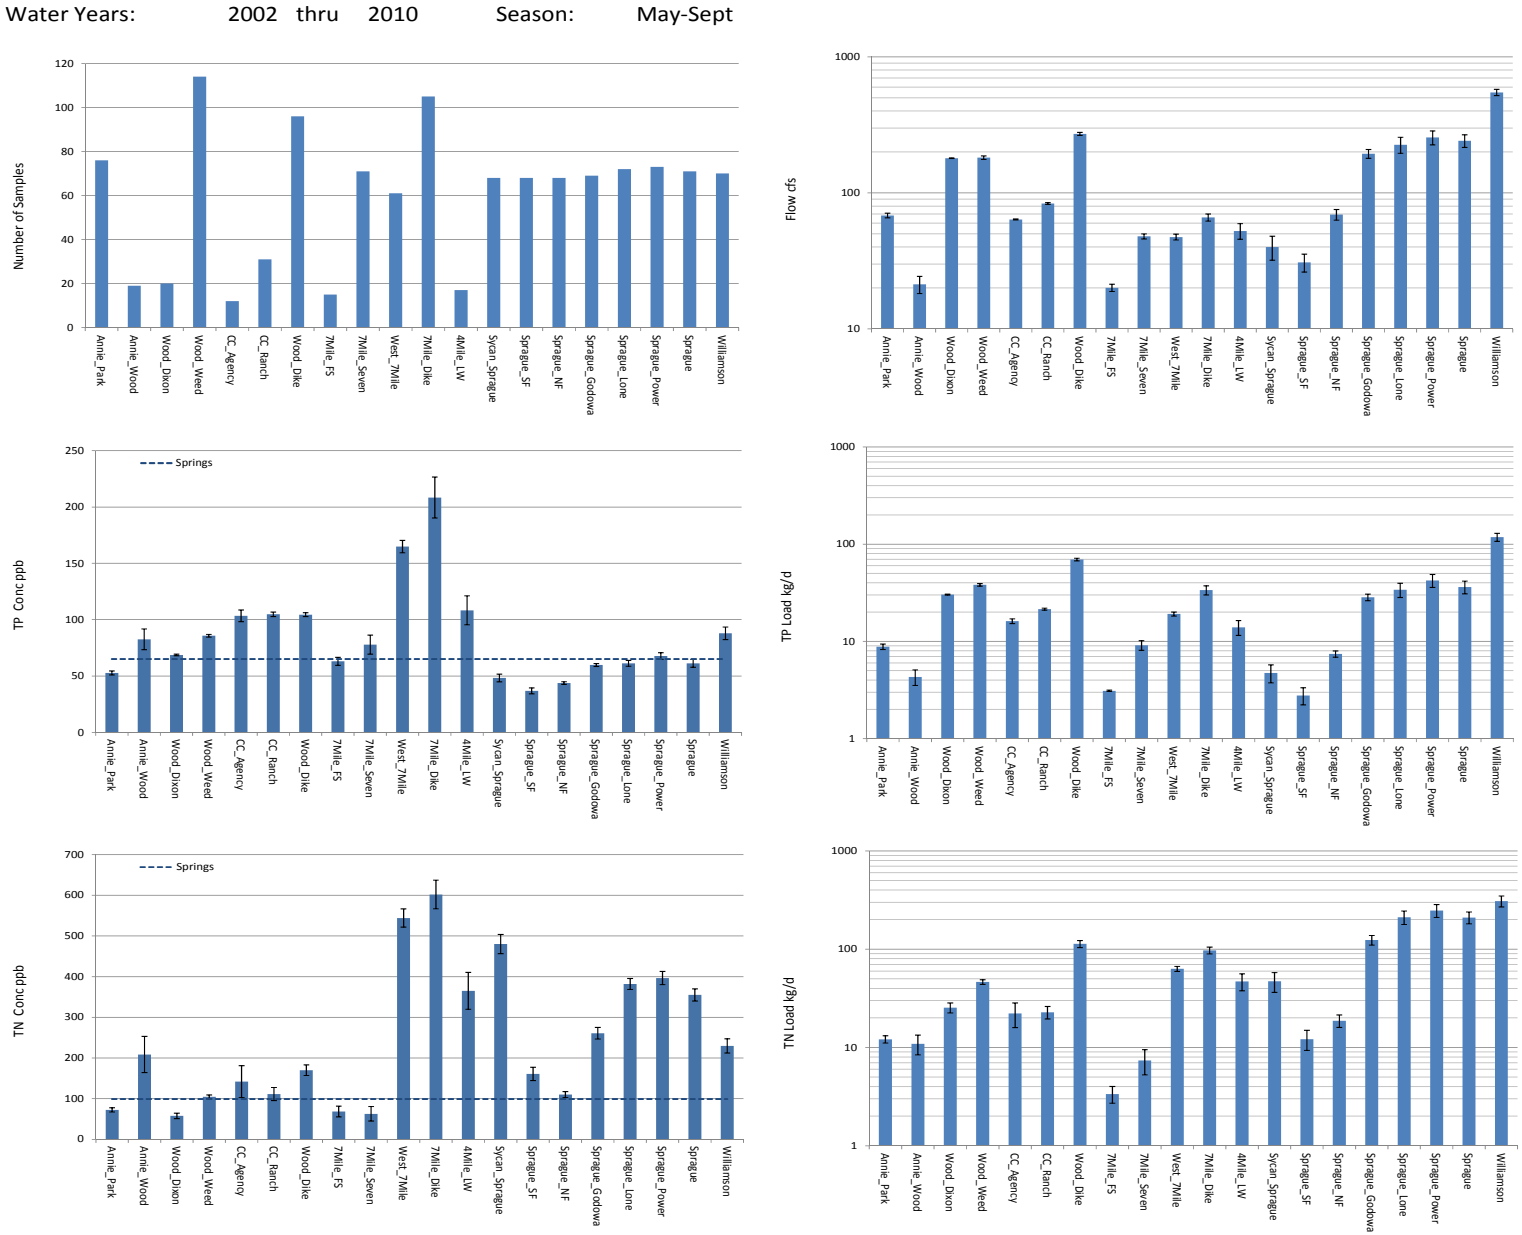

Figure D8: Alternative Background TP Concentration Estimates

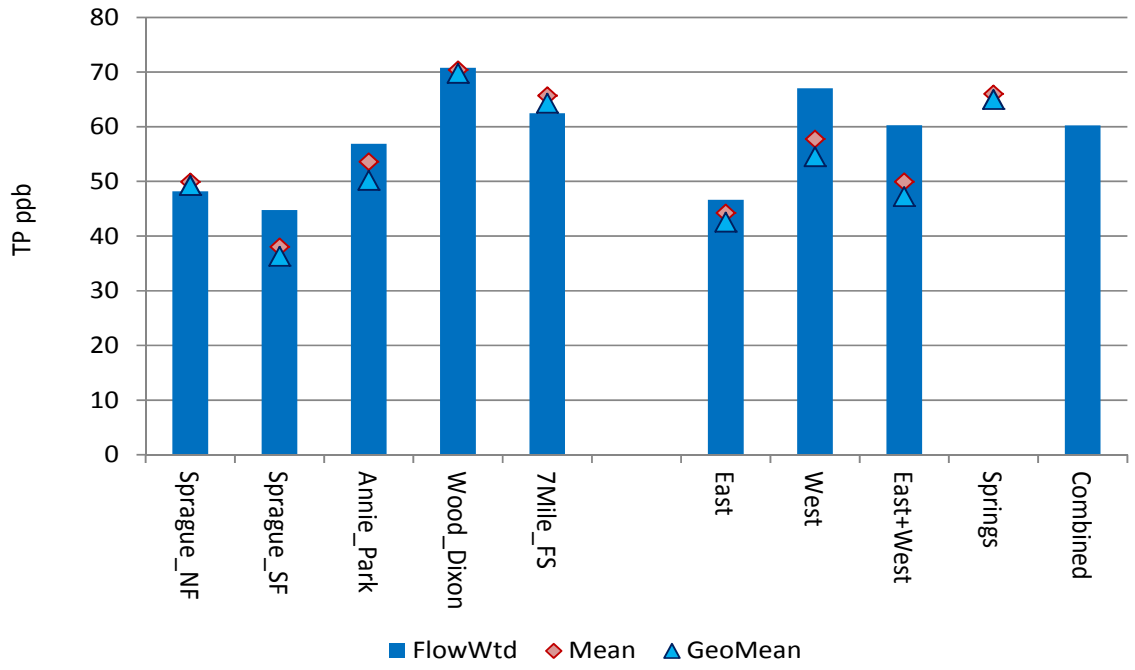
Background TP Concentration Estimated from Data Collected at Springs and Tributary Headwater Sites

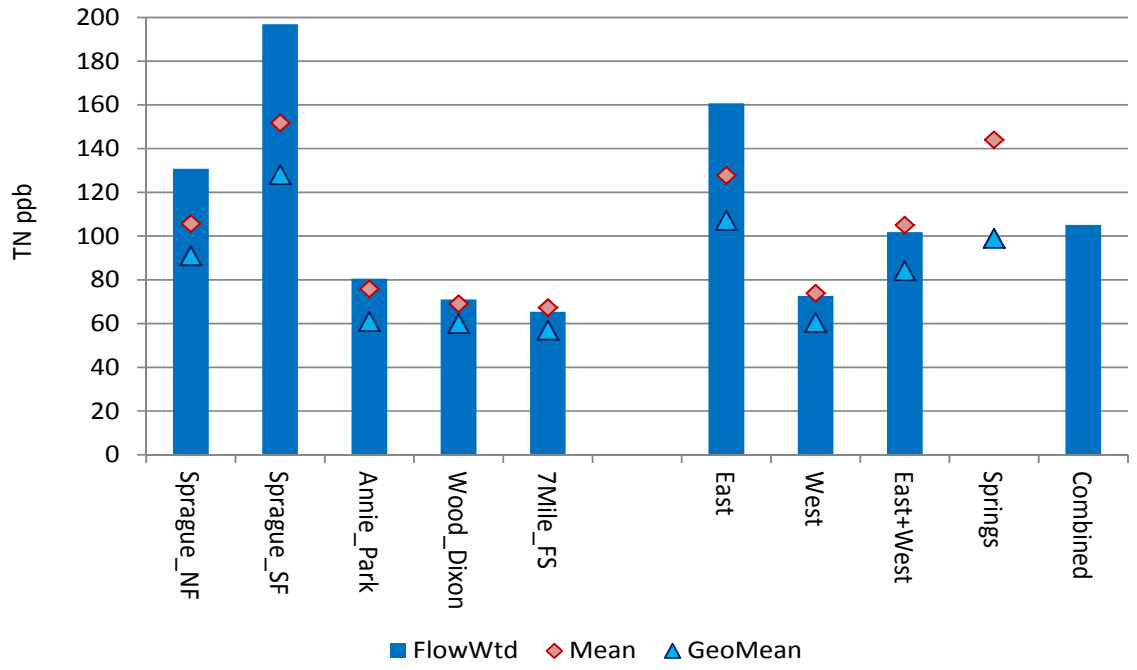


Estimate of Background Concs	Flow	Load	FWM Conc	
Watershed	hm3/yr	mt/yr	ppb	Background Conc Estimate
Sprague Total	502	23	47	East = Sprague N+S Fork
Williamson + Wood + 7 Mile + Pumps	809	54	67	West = An_Pk+Wd_Dix+7Mi_FS
Ungauged	280	18	65	Springs
Total External Inflow to Lake	1591	96	60	Combined FWM
Assumed in Update	1591	103	65	
Walker & Kann (1999)	1653	104	63	
TMDL Goal, ODEQ (2002)	1653	109	66	

Subbasin FWMs computed using flows paired with biweekly samples, WY 2002-2010.
Combined FWM is flow-weighted across basins using WY 1992-2010 mean flows.
Basin mean flows are from updated lake mass balance, WY 1992-2010 .

Figure D9: Alternative Background TN Concentration Estimates

Background TN Concentration Estimated from Data Collected at Springs and Tributary Headwater Sites



Estimate of Background Concs	Flow	Load	FWM Conc	
Watershed	hm3/yr	mt/yr	ppb	Background Conc Estimate
Sprague Total	502	81	161	East = Sprague N+S Fork
Williamson + Wood + 7 Mile + Pumps	809	59	73	West = An_Pk+Wd_Dix+7Mi_FS
Ungauged	280	28	99	Springs
Total External Inflow to Lake	1591	167	105	Combined FWM
Assumed in Update	1591	158	99	
Walker & Kann (1999)	1653	197	119	
TMDL Goal, ODEQ (2002)	1653	#N/A	#N/A	

Subbasin FWMs computed using flows paired with biweekly samples, WY 2002-2010.
Combined FWM is flow-weighted across basins using WY 1992-2010 mean flows.
Basin mean flows are from updated lake mass balance, WY 1992-2010 .

Notes

a flow data revisions

b change in load calculation algorithm (regression with interpolation vs. simple interpolation)

c revisions to pumped drainage areas & concentrations

d update of spring concentration estimates

e update of precipitation & evaporation estimates

f net result of changes in individual terms

Appendix F
Seasonal & Yearly Variations in Mass Balance Terms

Figures

Figure F1: Seasonal and Annual Variations in Mass Balance Terms

Description: Each figure shows the monthly, seasonal and annual variations in each mass balance term and nutrient species including:
Time series plots of monthly flows (shaded), nutrient loads (lines) and concentrations (lines) by mass balance term.
Annual mean +/- 1 standard error of flows, loads and concentrations by water year and multi-year periods
Monthly mean +/- 1 standard error of flows, loads and concentrations by month and season
Trend slopes +/- 1 standard error and level of significance (p-value) by month and season, linear regression

Variables: Flow, Total P, Total N

Seasons: Non-growing Season, October-April
Growing Season, May-September
Peak Algal Growth Season, June-August

Note: **Trend summaries in these figures are based on linear regression estimates and may differ from slopes and significance levels reported using the Seasonal Kendall Test, which is a more robust and powerful trend test, shown in Appendix G**

Table G1: Tabulated Results for Seasonal Kendall Trend Tests

Description: Trend slopes and significance (p-value) for flow, nutrient load and concentration using Seasonal Kendall test over period of record (WY 1992-2010) and Mann Kendall test based on annual mean values.

Variables: Flow, Total P Load and Concentration, Total N Load and Concentration

Total Pages: 33

Figure G1: Summary of Seasonal Kendall Trend Test

Description: Trend slopes and significance (p-value) for flow, nutrient load and concentration using Seasonal Kendall test over period of record (WY 1992-2010)

Panels: Trend Slope in original units (e.g. ppb/yr for concentration)
Percent Trend Slope computed by dividing trend slope in original units by mean value over the period, except for retention which is computed relative to Total External Inflows
Mean values for each term and variable for aiding interpretation of the relative magnitude of trend slopes between terms

Variables: Flow, Total P, Total N

Figure G2: Seasonal Kendall Trend Tests by Term

Description: Monthly and annual time series of flow, nutrient load and concentration for each term and variable (TP and TN), percent trend slope relative to long-term mean value (for retention computed relative to mean total external inflows), and trend slopes in original units (e.g. ppb/yr for concentration)

Variables: Flow, Total P, Total N

Seasons: October-March (Non-growing Season)
April-September (Growing Season)
October-September (Water Year)
Annual (Trend in Annual Mean Flow, Load and FWM Concentration)

Note: Trends shown in these plots computed over entire period of record (1992-2010)
Trends for "Annual" denotes Mann-Kendall Test applied to annual mean flow, load, and FWM concentration

Figure G3: Diagnostic Plots of Seasonal Kendall Trend Tests by Term and Variable

Description: Monthly and annual time series of flow, nutrient load and concentration for each term
Time series grouped by month over the period of record
Percent trend slope relative to long-term mean value (for retention computed relative to mean total external inflows)
Trend slopes in original units (e.g. ppb/yr for concentration)

Variables: Flow, Total P Load and Concentration, Total N Load and Concentration

Seasons: October-March (Non-growing Season)
April-September (Growing Season)
October-September (Water Year)
Annual (Trend in Annual Mean Flow, Load and FWM Concentration)

Note: Trends shown in these plots computed over entire period of record (1992-2010)
Trends for "Annual" denotes Mann-Kendall Test applied to annual mean flow, load, and FWM concentration

Appendix H
Annual and Seasonal Variations in Nutrient Species Concentrations

Figures

Figure H1: Annual and Seasonal Variations in Nutrient Species Concentrations

Description: Monthly and annual geometric mean time series of concentrations for each major sampling station
Time series of monthly geometric mean concentraiton grouped by month over the period of record

Variables:		
	TP	Total Phosphorus
	SRP	Soluble Reactive Phosphorus
	TN	Total Nitrogen
	NH4N	Ammonia Nitrogen
	NO23N	Nitrite+Nitrate Nitrogen

Stations:		
	7Mile_Dike	Sevenmile Canal at Dike Road
	Wood_Weed	Wood River at Weed Road
	Wood_Dike	Wood River at Dike Road
	Sprague	Sprague River
	Williamson	Williamson River
	Outlet	Lake Outlet

Note: Sample data for TN, NH4N and NO23N were constained to the maximum detection limits over the period of record (100 ppb for TN, 10 ppb for NH4N and NO23N)
Excludes three outliers of NO23N at Wood_Dike (7/7/1992) and Wood_Weed (7/7/1992 and 11/5/1991)
Monthly and annual geometric means computed directly from sample concentration data
Results for TP and TN may be different from those shown in Appendix G, which are based on monthly concentration and load estimates computed for the mass balance (see Appendix B)
Annual Geomean panel includes LOESS smooth with +/- 1 standard error bands
Monthly Geomean by Month panel includes LOESS smooth without standard error bands
